Challenge

Strategy

Data mapping gaps → frequent updates in NAMASTE / ICD-11 can break mappings

Automated ingestion + version-controlled FHIR ConceptMaps (exact, broader, narrower)

Clinician adoption → dual coding workflow resistance

Auto-complete dual codes + decision support

Regulatory compliance → ensuring insurance/EMR trust

FHIR-compliant ConceptMaps with versioning + audit trail

Performance → high latency querying large datasets / LLMs

Multi-layer caching + pre-mapped ConceptMap during NAMASTE + ICD TM2 ingestion → avoids recurring LLM API calls

Digital infrastructure gaps → lack of ABHA / rural clinics

Offline-first mode with local preloaded mappings, sync when online
